KEY TREATMENTS AT GLANCE

HAIR TRANSPLANT

HAIR TRANSPLANT PROCEDURE

Hair Transplant is a surgical technique that moves hair follicles from donor site of the scalp to a bald part of the scalp known as the recipient site. This is currently the most successful treatment available, which is primarily used to treat male/female pattern baldness. This is minimal invasive procedure in which grafts are taken from the donor area which contains hair follicles are genetically resistant to balding are transplanted back to the bald / affected area of the scalp.

TYPES OF HAIR TRANSPLANT TREATMENTS

FUT (Follicular Unit Transplantation): This is one of the conventional Hair Transplant methods in which a strip of skin with hair follicles (grafts) are removed from the donor area of the scalp and then divided micro-surgically. Then these follicles are separated from the donor strip carefully to ensure that grafts should not be damaged. Once this process is done then grafts are transplanted at the recipient area of the scalp.

This method is used normally where large numbers of grafts (approx. 5000+) are required to be inserted in one session. The survival rates of the transplanted grafts are high and there is minimal wastage. This procedure ensures greater Hair density & is one the popular techniques worldwide. This procedure also consumes lesser time.

FUE (Follicular Unit Extraction): This is the modern age hair transplant method available & widely accepted across the world. In this method individual follicular units (grafts) are extracted from the donor area and inserted back in to the recipient bald area. Post this procedure; there are no sutures, scars or pain involved however this technique takes higher time than FUT. But the brighter side is that in this procedure scalp heals quickly and the process is less invasive causing very less discomfort to the patient.

DO HAIR TRANSPLANTATION LAST FOREVER?

Although your transplanted hairs look alike your natural hair with fuller density and coverage, you may still wonder whether these hairs which are transplanted last forever. The square root clinic provides the permanent hair transplantation technique that can sustain for a very long time as it is performed by our skilled and expert surgeon. However, the results may vary from

Hair Transplantation involves the process of planting hair follicles in the recipient site where there is excessive hair loss or balding. The donor area which is known as the safe zone is carefully selected, usually, the sides and back of the scalp are chosen as the hair roots are strong enough and they are resistant to a natural and powerful metabolite called Non-compliance- Some patients refuse to take anti-hair fall medications like minoxidil or finasteride.

- Hair Thinning: The non-transplanted surrounding hairs keep on getting thinner.
- Age: As the hair shaft diameter decreases after a certain age, this is the main reason why the transplanted hairs do not persist for a long time.

HAIR LOSS TREATMENT

PRP – ADVANCED NON INVASIVE HAIR REGROWTH THERAPY

In recent time, Medical science has brought forth lot of innovative treatments for people who are suffering from excessive hair loss. While hair transplantation is good option for those having large bald area however those who is experiencing extreme hair falls but did not reach to baldness stage, PRP or Platelet Rich Plasma therapy is the most innovative treatment available and gaining rapid popularity.

WHAT IS PLATELET RICH PLASMA (PRP) TREATMENT?

Platelet Rich Plasma therapy is a non-surgical treatment for people suffering from hair loss where your own Platelet-Rich Plasma (PRP) extracted from your blood is injected into the scalp skin, then the growth factors in your blood cells do their job and hair growth is naturally stimulated.

Platelets are the clotting cells of our blood having potential of faster healing, which release growth factors in the blood that augments the healing process. PRP treatment is ideal for both men and women. Dermatologist recommends 4-6 sessions with interval of approx. 4-5 weeks between each session for getting optimum results.

HOW PRP THERAPY IS PERFORMED AT SQUARE ROOT?

Our dermatologist thoroughly examine the scalp to check the affected area, then draw approx. 20 ml blood from the patient and then by using centrifuged machine, PRP is separated and removed from the rest of the blood. After this process, doctor gives topical anaesthesia to ensure that no pain is experienced while injecting PRP in to the scalp on the target area.

LASER HAIR REMOVAL TREATMENT

In today's modern world; everyone wants to have awesome, beautiful & flawless skin, Thanks to the advanced technology through which permanent laser hair reduction can be done with more ease, comfort and lesser time duration due to which it is now very common & most popular among women & men of all age group.

Laser Hair Removal is a process of removing unwanted hair by means of exposure to pulses of laser light that destroy the hair follicle inside the skin. Key method involved under this treatment is selective photothermolysis (SPTL) in which matching of a specific wavelength of light and pulse duration is done to obtain optimal effect on the targeted tissue with minimum impact on surrounding tissue.

Exact principle of laser Hair Removal is based on light absorption wherein laser light energy gets absorbed by the pigment (melanin) & then sent downwards to the hair shaft, which eventually disrupt the growth factor of the root. Light energy is transformed to heat energy that heats the Hair follicle to a critical temperature at which point it is cauterised. The general principle is that between 6-8 sessions, approx. 90% growth of hairs can be eliminated permanently.

IMPORTANT FACTS FOR LASER HAIR REMOVAL (LHR)

- Laser Hair Removal treatment is suggested every 8-10 weeks for the body & 4-6 weeks on the face.
- 80-90% Results can be seen after 6-8 session.
- Dark Hair responds best to LHR due to high pigment concentration in Hair Follicle.
- At least 3-4 weeks before one is suggested to avoid Waxing, Plucking or Threading.
- Prior to treatment there is absolutely NO to use of Self Tanner, Solariums or Any Sun Exposure.

ANTI-AGEING BOTOX TREATMENT

Looking for a wrinkles and line free face? Botox and Square Root can help you with it.

Botulinum toxin type A (also commonly known as Botox) is commonly thought of as an anti-wrinkle treatment. Botox has been in practice since long in various medical treatments, but its most prominent use nowadays is as a cosmetic treatment to treat facial muscle spasms. It leads to diminished facial wrinkles.

I have heard about it, but what is Botox?

Botox is a brand which uses purified form of botulinum toxin type A. It is a chemical toxin produced by Clostridium botulinum bacteria. Botox causes Botulism which is a type of controlled infection that results in temporary muscle paralysis. Under proper administration, they are safe as injectable medicine as they are used in very small quantities and used on specific sites where treatment is needed.

In common words, botox is an injectable muscle relaxing treatment which helps you fight facial wrinkles (most common use of Botox). It causes temporary muscle paralysis and makes it numb and lifeless. It helps reducing the appearance of facial wrinkles in the treated patient. It is a minimal invasive treatment in nature. It is considered really safe, effective treatment for wrinkles and fine lines. It also treats lines on forehead between your eyebrows. It causes reduced nerve activity in treated area, thus reducing the stress and makes injected area

What is BOTOX injection used for?

Botulinum toxin type A is approved medical injection by IMA. It can be used for various purposes as described below:

Cosmetic treatments

Botox can be used to treat

Vertical frown lines - They are also known as glabellar lines. They are the lines between your eyebrows. They get prominent when you frown, squint or try to concentrate on something)

- Horizontal forehead lines
- Lines at the eyes corner (also commonly known as crows feet)

Medical Treatments

Medical conditions which can be taken care of with Botulinum toxin type A are:

- Blepharospasm - which is twitching or eyelid spasm
- Cervical dystonia, or spasmodic torticollis - this is a type of muscle spasm in neck
- Facial or muscle spasm in other parts of the body
- Muscle spasticity due to cerebral palsy - which is a group of disorders affecting body posture and movement (motor disorders)
- Strabismus - it is a medical condition where eyes are not properly aligned. It can also be injected into bladder muscle to help in case of overactive bladder
- Hyperhidrosis - it is a medical condition where excessive underarm sweating occurs.
- It can also help you with migraine headaches in people suffering from chronic migraine.

ACNE & SCARS TREATMENT

In Today's world everyone wants to have a brighter face, brimming with confidence and self-esteem. Each one of us wants to look young with healthier skin, however we all know that just a simple glance at the mirror may bring it down once you observe acne on your skin, pits or scars. Scars are natural trails left behind by pimples.

Actually Acne is rather very mysterious, as we really never know that when the next one will pop up to leave a blemish or a pit on your face. Acne & subsequent scars are now a day common problem among teenagers & young adults as most of them meddle with them in front of the mirror.

CAUSES OF ACNE

There are various reasons for Acne. In simple words, acne is normally caused by excessive production of natural oil (sebum) that gets deposited and trapped in to the skin pores & then it causes skin inflammation healing with either a pit or blemish. If someone has excessive oily skin then it would be a hub and ideal condition for pimples to grow. Further Hormonal imbalance, stress can also lead to acne and scars.

But the good point is that such Acne and Scar can be controlled with right treatment and it doesn't call for brooding because a visit to Square Root will ensure you find the right consultation and solution for it. We have a very effective and customized solution for all acne & scar problem, which are subsequent to an elaborate consultation and standardized assessment procedure.

DIFFERENT TYPES OF ACNE SCARS?

- Macular or flat scars are dark brown, or reddish in color.
- Rolling scars are those with gentle sloping edges, which are sunken below the surrounding skin.
- Boxcar scars which have sharp edges and are sunken like craters
- Ice pick scars appear like deep pits looking like large open pores.
- There are Popular scars & keloidal scars but lots of people are affected with a combination of rolling scars, ice pick scars and boxcar scars.
